

# JS-Drive controller + JS-Drive panel matched to the PRO panel casing

An exemplary interface of the panel .....	15
Initiating operations .....	15
Operating the 'UP' and 'DOWN' buttons .....	15
Saving worktop positions and memory operations .....	15
Settings of maximum and minimum height .....	15
Locking and unlocking .....	16
Restoring factory settings .....	16
Internal parameters and installation distance setting .....	16
Error codes .....	17

# An exemplary interface of the panel

---

## Description of panels' buttons:

Function button S – Invoke a function  
Save 1 button – Save and set height 1  
Save 2 button – Save and set height 2  
Save 3 button – Save and set height 3  
Save 4 button – Save and set height 4  
Up button 5 – Go UP  
Down button 6 – Go DOWN

## Initiating operations

---

When there is an abnormality in the system or the message „RST” appears on the manual controller, it is necessary to initialise the desk controller.

The initialisation operation consists of pressing and holding the 'DOWN' button until the motor stops, releasing it and then pressing „DOWN” for **5 seconds** to automatically enter initialisation mode. The „DOWN” button cannot be released at this point – if you release the „DOWN” button, the system will stop initialisation mode. When initialisation is complete, you will hear a beep, which indicates a successful initialization.

## Operating the 'UP' and 'DOWN' buttons

---

When the „UP” button is pressed, the worktop moves upwards until it reaches its maximum height. When the 'DOWN' button is pressed, the worktop moves downwards until it reaches its minimum height. When the „UP” or „DOWN” buttons are pressed briefly, the worktop moves a short distance respectively to reach a comfortable worktop position.

## Saving worktop positions and memory operations

---

Up to 4 desk positions (heights) can be saved in the PRO control panel. The saving method is as follows: set the desk to the desired height, when it is reached press the 'S' button and then select „save as X” (1-4), the position will be available under the selected button X (1-4).

## Settings of maximum and minimum height

---

The system supports saving a height range in which the worktop can move. The saving method is as follows: when the worktop is at the height you want to save as the limit, press the „UP” + „DOWN” buttons for **5 seconds** to save the position. You will hear a sound and see a message on the display that the position has been successfully saved. When the worktop is in the upper part of the height range the upper limit (maximum height) is stored, and when the worktop is in the lower part of the range the lower limit (minimum height) is stored.

Deleting a saved height range: reset the system and the height range is cancelled

## Locking and unlocking

Lock: Press and hold „S” + „UP” buttons simultaneously for **5 second**. When the display shows the „Loc” message, this means that the system has been locked and the height cannot be controlled.

Unlock: Press and hold „S” + „DOWN” buttons simultaneously for **5 seconds**. When the “Loc” message disappears, this means the system has been unlocked.

## Restoring factory settings

If you the desk frame has been replaced or if you need to restore the factory settings, press and hold the „UP” + „DOWN” buttons for **10 seconds**. After this time, you will hear a long beep and the parameters will be reset to the factory settings. A forced initialisation process will start.

## Internal parameters and installation distance setting

Press and hold the “S” button for **5 seconds** to enter the settings interface, the display will show „S-x” („x” flashes – „x” is a parameter group). At this point, press „1” to enter the parameter group and set the corresponding parameters, or press „UP” and „DOWN” to switch the parameter group. Once the parameters have been set, press „SET” (S) to return to the desk control interface.

The following parameters can be set:

- a) „S-1” change of units mm/inch - 0 means mm, 1 means inches,
- b) „S-2” anti-collision sensitivity based on speed - 0 means anti-collision is off, 8 means high sensitivity and 1 means low sensitivity,
- c) „S-3” upward motion overload sensitivity (motor current too high) - 0 means function deactivated, 8 means high sensitivity and 1 means low sensitivity,
- d) „S-4” sensitivity of overload in downward movement (motor current too high) - 0 means function deactivated, 8 means high sensitivity and 1 means low sensitivity,
- e) „S-5” indicates the mounting distance in cm,
- f) „S-6” automatic movement of the worktop - 0 means that you have to hold the button until the desired position is reached, 1 means automatic movement when the button is pressed, and any button stops it,
- g) „S-7” running time 2/18 - 0 means function is disabled (the system relies solely on the temperature protection controller), 1 means that the 2 min of movement for 18 min of rest function is enabled,
- h) „S-8” protection resulting from different lengths of the desk's legs - 0 means the function off, 1-8 mean 0.5°-4° difference respectively.

# Error codes

ERROR CODE	DESCRIPTION	SOLUTION
E01	Mains voltage exceeded by 45V	Check power supply
E02	Height difference between desk legs exceeds 1 cm	Initiate the desk
E04	Faulty connection of the manual controller or communication error	Check panel cable
E05	Displayed when the table/desk is locked	Release button and restart
E06	Main power supply start-up failed, voltage below 20V	Replace main power supply or check the main power supply connection cable
E07	Protection when the main power supply is operating, voltage below 20V	Reconnect power supply
E08	Desk / table tilted while moving	Re-initiate the desk
HOT	The temperature of the power supply is too high or has been running for more than 2 minutes in 18 minutes	Wait for the power supply to cool down or wait 18 minutes for the system to restart
E11	Motor No. 1 not connected	Check connection cable
E12	Error in current sampling channel of motor No. 1	Replace controller
E13	Motor No. 1 is out of phase, there has been a disconnection with the controller	Check if motor can be connected to the controller
E14	Hall fault of motor No. 1 or disconnection of Hall wires	Check Hall signal or replace connection cable
E15	Internal short circuit of motor No. 1	Replace motor
E16	Motor No. 1 locked	Re-initiate the desk
E17	Motor No. 1 runs in the wrong direction	Switch motor cables or Hall wires
E18	Load on motor No. 1 is too high, overload	Reduce the load on the worktop
E21	Motor No. 2 not connected	Check connection cable
E22	Error in current sampling channel of motor No. 2	Replace controller
E23	Motor No. 2 is out of phase, there has been a disconnection with the controller	Check if motor can be connected to the controller
E24	Hall fault of motor No. 2 or disconnection of Hall wires	Check Hall signal or replace connection cable
E25	Internal short circuit of motor No. 2	Replace motor
E26	Motor No. 2 locked	Re-initiate the desk
E27	Motor No. 2 runs in the wrong direction	Switch motor cables or Hall wires

<b>E28</b>	Load on motor No. 2 is too high, overload	Reduce the load on the worktop
<b>E40</b>	Serial connection has a break in the controller	Check connection cable
<b>E41</b>	Serial signal error	Check connection cable or replace controller
<b>E42</b>	Memory error	Replace controller
<b>E43</b>	Stop - sensor fault in case due to an obstacle	Replace controller
